

# 1<sup>st</sup> EUSST Webinar

---

SST Cooperation  
27 November 2019

# Agenda

- 10:30-10:40 Welcome to the 1<sup>st</sup> EUSST Webinar
- 10:40-11:00 EU SST Support Framework
- 11:00-12:00 SST Services and EUSST Portal
- 12:00-12:20 Questions and Answers
- 12:20-12:30 Conclusions and Closure

# Speakers

**Mrs Amélie Gravier**  
EUSST Consortium

**Mr Paulo Nunes**  
EUSST Front Desk

**Ms Cristina Pérez**  
Spanish SST Operational Centre  
Expert on CA service

**Dr Elena Vellutini**  
Expert on RE and FG services

**Mr Florian Delmas**  
French SST Operational Centre  
Expert on CA service

**2<sup>nd</sup> Lt Moreno Peroni**  
Italian SST Operations Centre  
Expert on RE and FG services

# EU SST Support Framework

A background image showing a view of Earth from space. The horizon is visible as a bright blue line, with the dark blue and black of the ocean and sky above it. The lower part of the image shows a dark, textured surface, likely the ocean, with some lighter patches indicating clouds or land. The overall scene is set against a black background, suggesting the vastness of space.

# The foundation

## Decision 541/2014/EU for an SST Support Framework

### Decision of the European Parliament and of the Council of 16 April 2014 establishing a Framework for Space Surveillance and Tracking Support

« Ensuring the long-term availability of European and national space infrastructure, facilities and services which are essential for the safety and security of the economies, societies and citizens in Europe » (article 3)

With the aim to (article 4):

« Establish a SST capability at European level and with an **appropriate level of autonomy** » :

- (a) The establishment and operation of a **sensor function** consisting of a network of Member State ground-based and/or space-based sensors, including national sensors developed through ESA, to survey and track space objects and to produce a database thereof;
- (b) The establishment and operation of a **processing function** to process and analyse the SST data at national level to produce SST information and services for transmission to the SST service provision function;
- (c) The setting up of a function to provide **SST services** as defined in Article 5(1) to the entities referred to in Article 5(2).

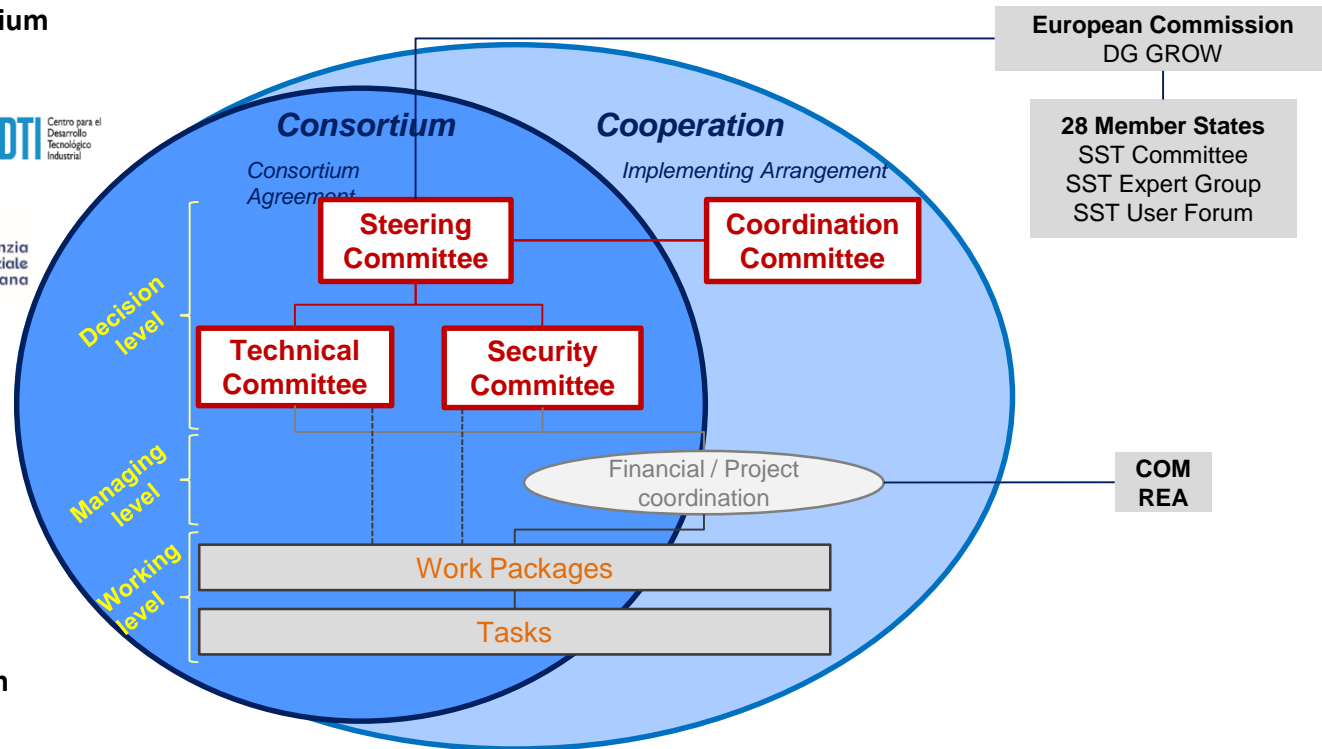

# Governance of the Consortium

## State of play

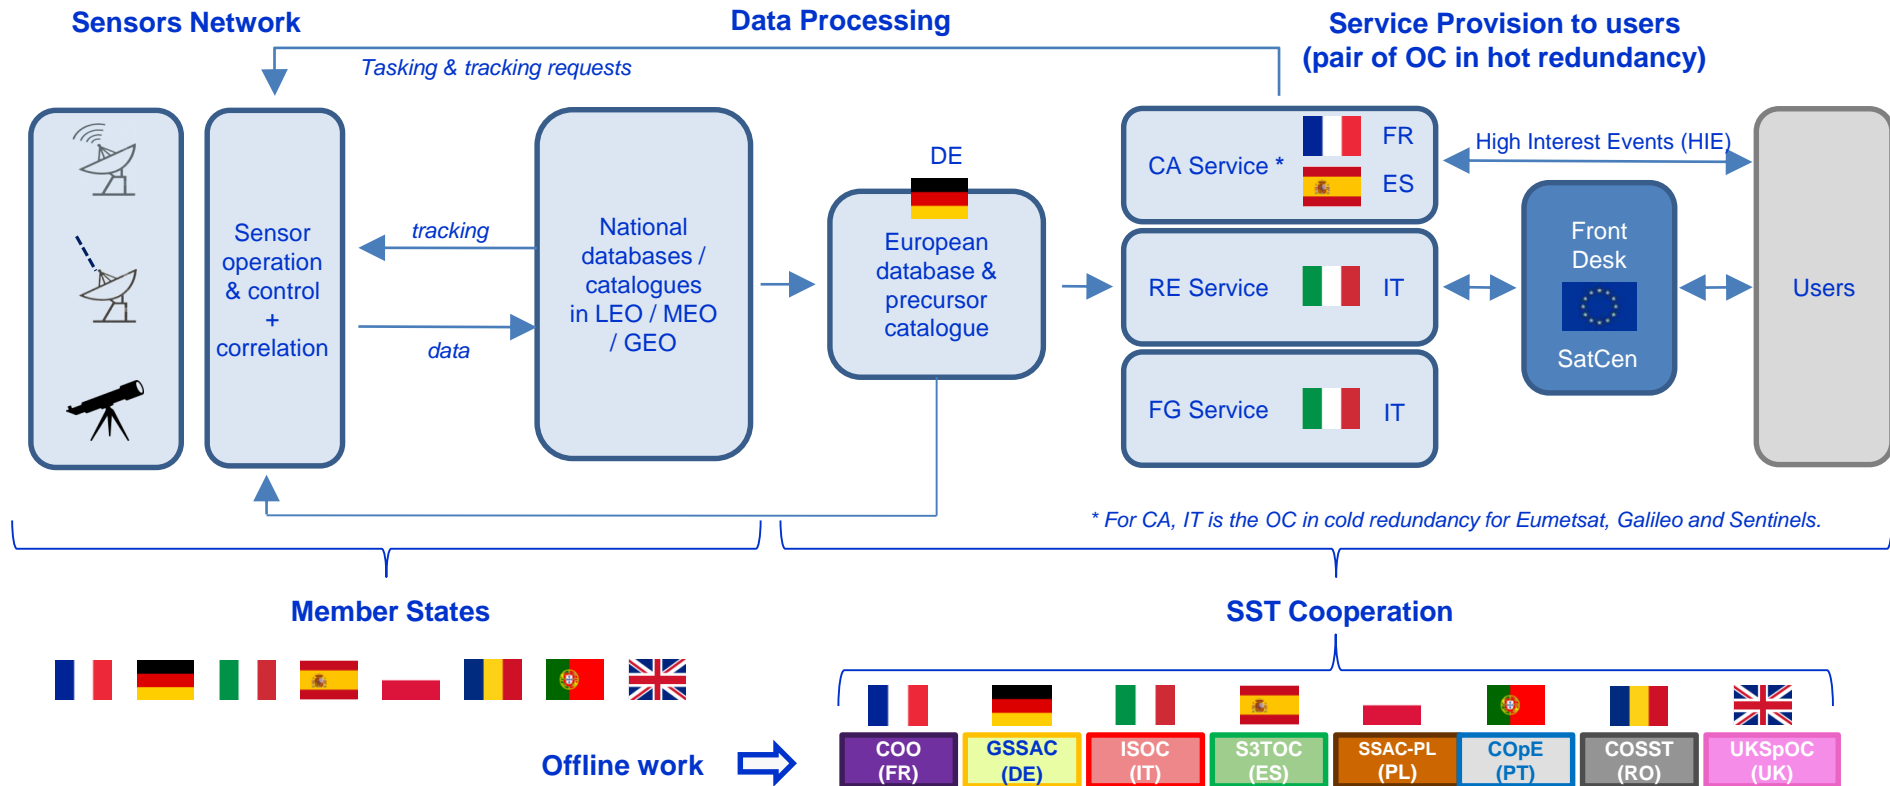

- National Designated Entities from 8 MS are composing the **EU SST Consortium**

- EU SST Consortium + EU SatCen are composing the **SST Cooperation**

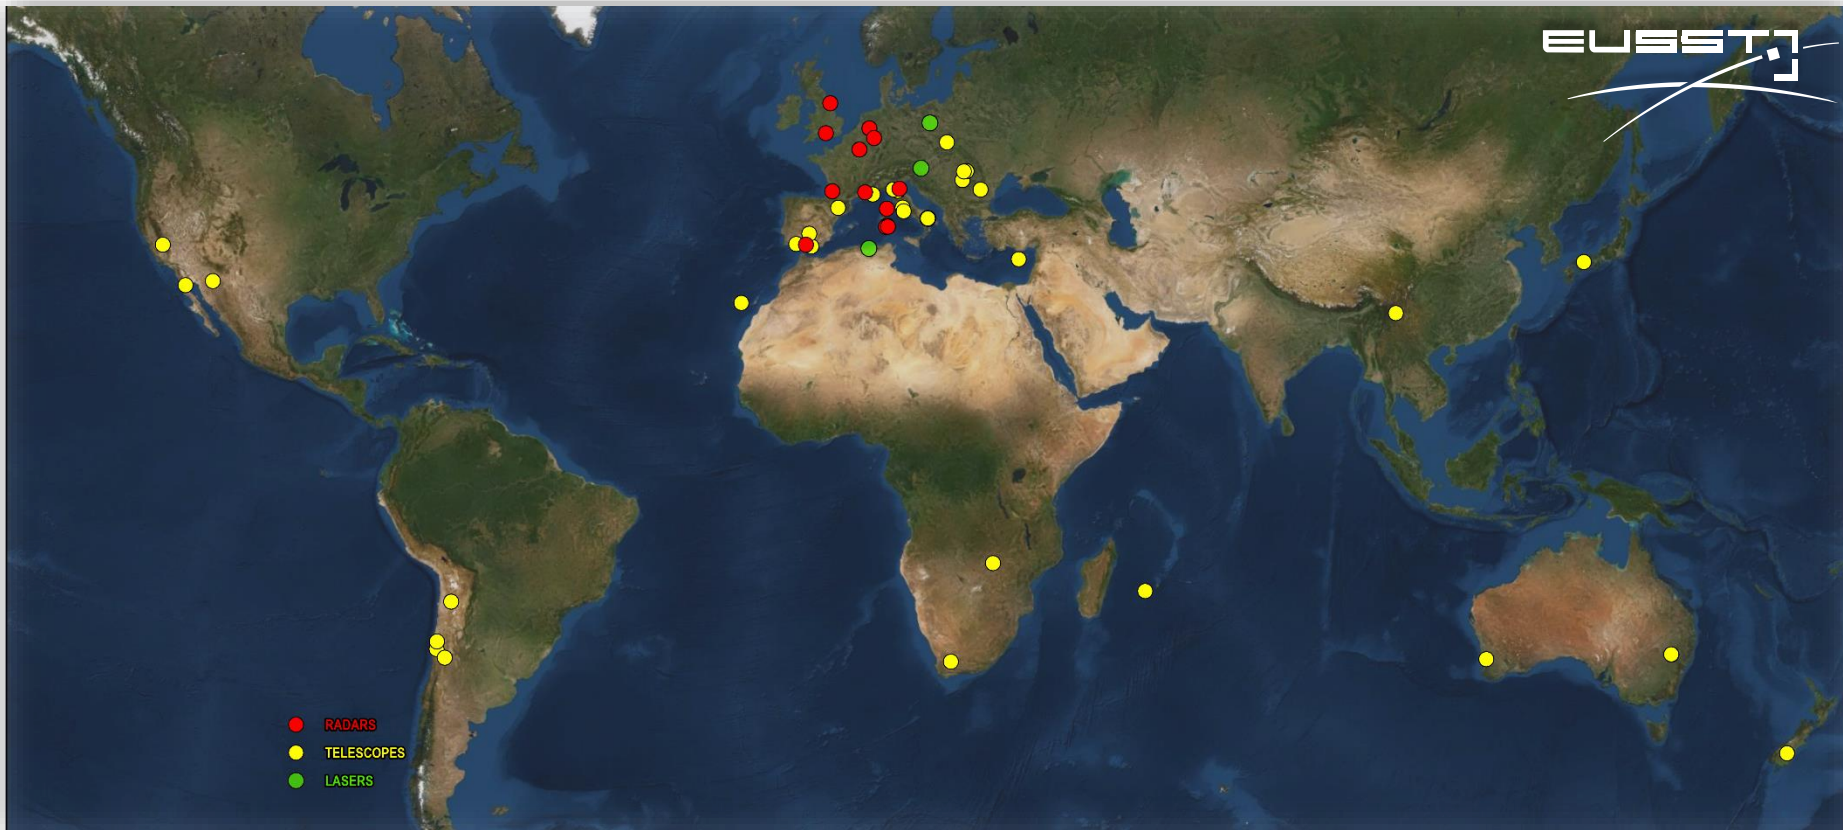

# Service Provision Model

# Sensor Network

Network of sensors composed of 35 telescopes, 12 radars and 4 lasers

(In operation as of 1<sup>st</sup> April 2019)

# Service Provision to Users

## SST Services

- **Collision Avoidance.** It provides the **risk assessment of collision** between spacecraft or between spacecraft and space debris and the generation of collision avoidance products.
- **Re-entry Analysis.** It provides the **risk assessment of the uncontrolled re-entry of man-made space objects** and space debris into the Earth's atmosphere and the generation of related information.
- **Fragmentation Analysis.** It provides the **detection and characterization of in-orbit fragmentations**, break-ups or collisions;

**SST Services are described in the Service Portfolio available on the EUSST Portal**

# Service Provision to Users

## EUSST Front Desk

### SST Consortium

Responsible for generating the SST services and their information

### SST Front Desk

Interface for the delivery of the SST services in accordance with the Data and Information Policy

**EUSST Service Provision Portal** for the delivery of the SST information and services and a **EUSST Helpdesk** to support users

<https://sst.satcen.europa.eu>

### **User Coordination**

User approval and uptake

### SST Users

SST services to be provided to:

- All Member States
- the Council
- the Commission
- the EEAS
- public and private spacecraft owners and operators
- public authorities concerned with civil protection.

**106 user accounts**  
**(60 organizations)**

**129 Satellites registered for CA**

# SST Users Organisations

Non-exhaustive list of organisations  
As of end of September-2019

# SST Users

## Users vs Organisations

**106** | **60**  
USERS | ORGS  
18 EU MS

**Collision  
Avoidance**

**45** | **22**  
USERS | ORGS

**129**  
satellites

**Re-entry  
Analysis**

**70** | **46**  
USERS | ORGS

**Fragmentation  
Analysis**

**60** | **39**  
USERS | ORGS

Users – CA service

Users – RE service

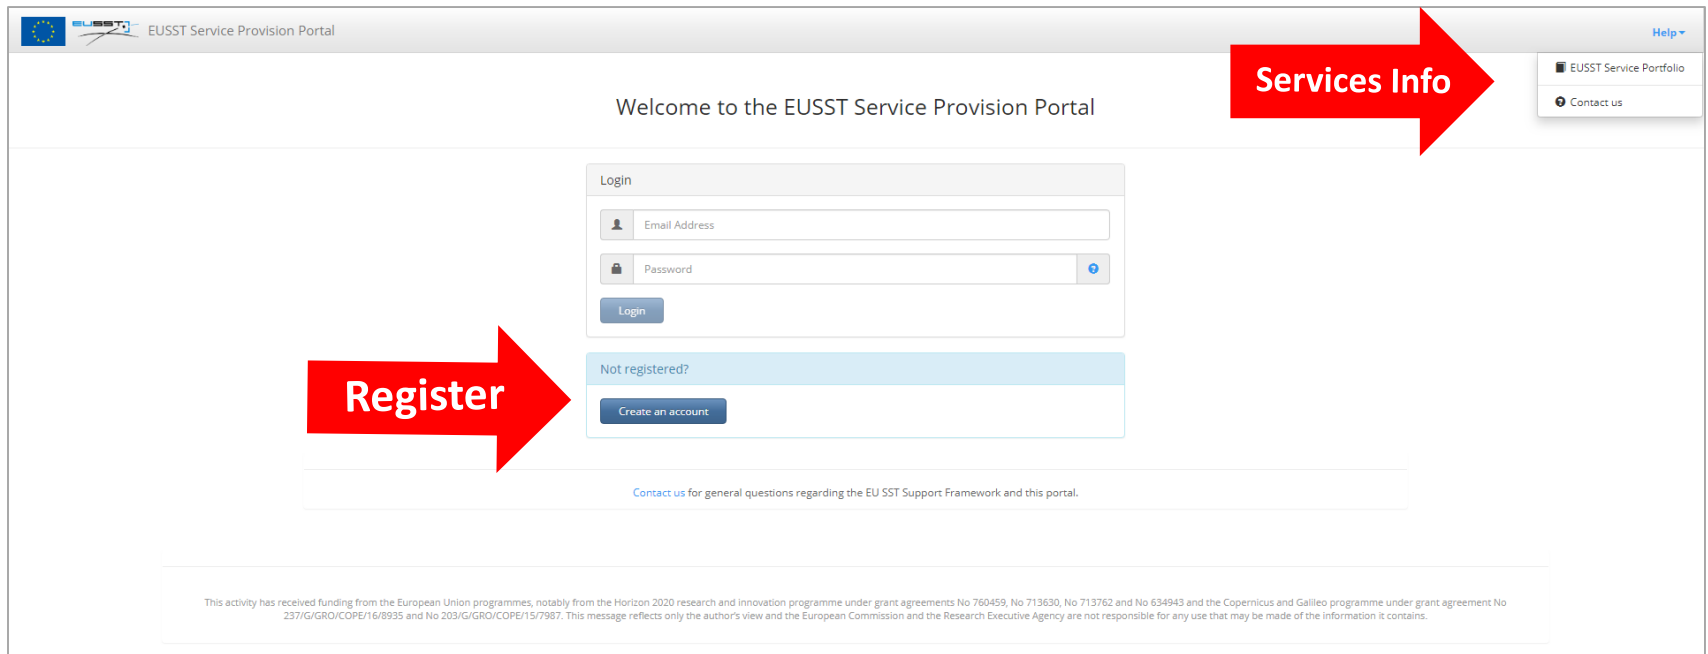

Users – FG service

\*Metrics as of end of September-2019. In Q2, Q3-19 the decrease of users is due to one organization requesting to merge several associated user accounts (10 accounts have been transformed into 2).

# Users Registration

Potential users entitled to receive SST services can request access through the EUSST Portal at [sst.satcen.europa.eu](https://sst.satcen.europa.eu)

The screenshot displays the EUSST Service Provision Portal interface. At the top left, the EUSST logo and the text "EUSST Service Provision Portal" are visible. A "Help" link is in the top right. A red arrow labeled "Services Info" points to a sidebar menu containing "EUSST Service Portfolio" and "Contact us". The main content area features a "Welcome to the EUSST Service Provision Portal" message. Below this is a "Login" section with fields for "Email Address" and "Password", and a "Login" button. A red arrow labeled "Register" points to a "Not registered?" section with a "Create an account" button. At the bottom, a link says "Contact us for general questions regarding the EU SST Support Framework and this portal." A footer contains a disclaimer about funding from the European Union.

This message reflects only the author's view and the European Commission and the Research Executive Agency are not responsible for any use that may be made of the information it contains.

# Collision Avoidance Service

A view of Earth from space, showing the horizon and clouds. A bright, colorful comet streak is visible in the upper right corner of the image.

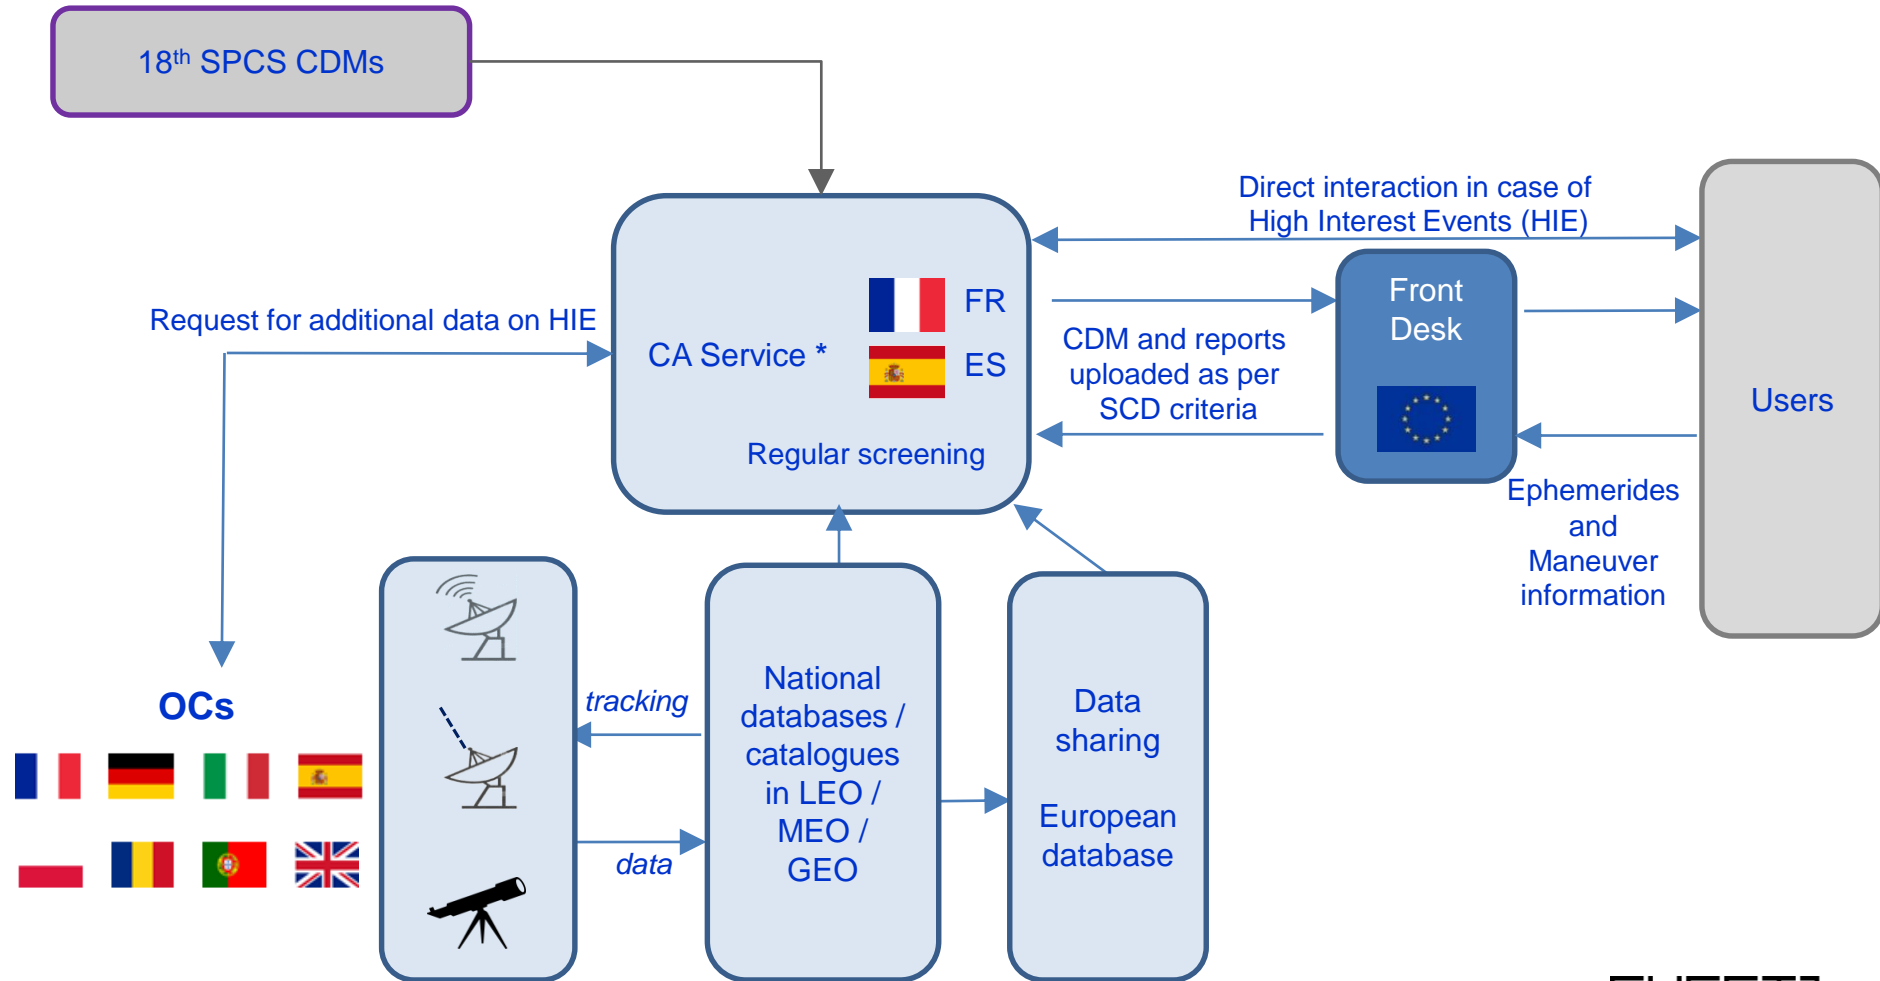

# Collision Avoidance Service Description

The Collision Avoidance Service:

- provides the **risk assessment of collision** between spacecraft or between spacecraft and space debris and the generation of collision avoidance products.
- consists on processing all available information, concluding with the provision of products derived from the detection and analysis of:
  - **High Interest Event (HIE)**, close approach that require a further analysis and which might request a mitigation manoeuvre due to its high level of risk (severity ALERT).
  - **Interest Event (IE)**, close approach that require a further analysis due to its level of risk (severity WARNING).
  - **Info Event (INFO)**, close approach with a low level of risk (severity INFO).
- Events are categorised according the criteria defined with users and reflected in the **Service Configuration Document (SCD)**.

# CA Service Provision Mechanism (I)

# CA Service Provision Mechanism (II)

- Provision mechanism based on hot redundancy concept:
  - provided by a pair of Operational Centres (OCs) with nominal (single point of contact for users) and hot redundant roles;
  - service provided through the EUSST Service Provision Portal.
- Exceptionally, a cold redundant OC can be part of the provision mechanism allowing it visibility through the entire CA process.
- All OCs cooperate, in particular for HIE with data from sensors contributing to the EUSST.

# Collision Avoidance

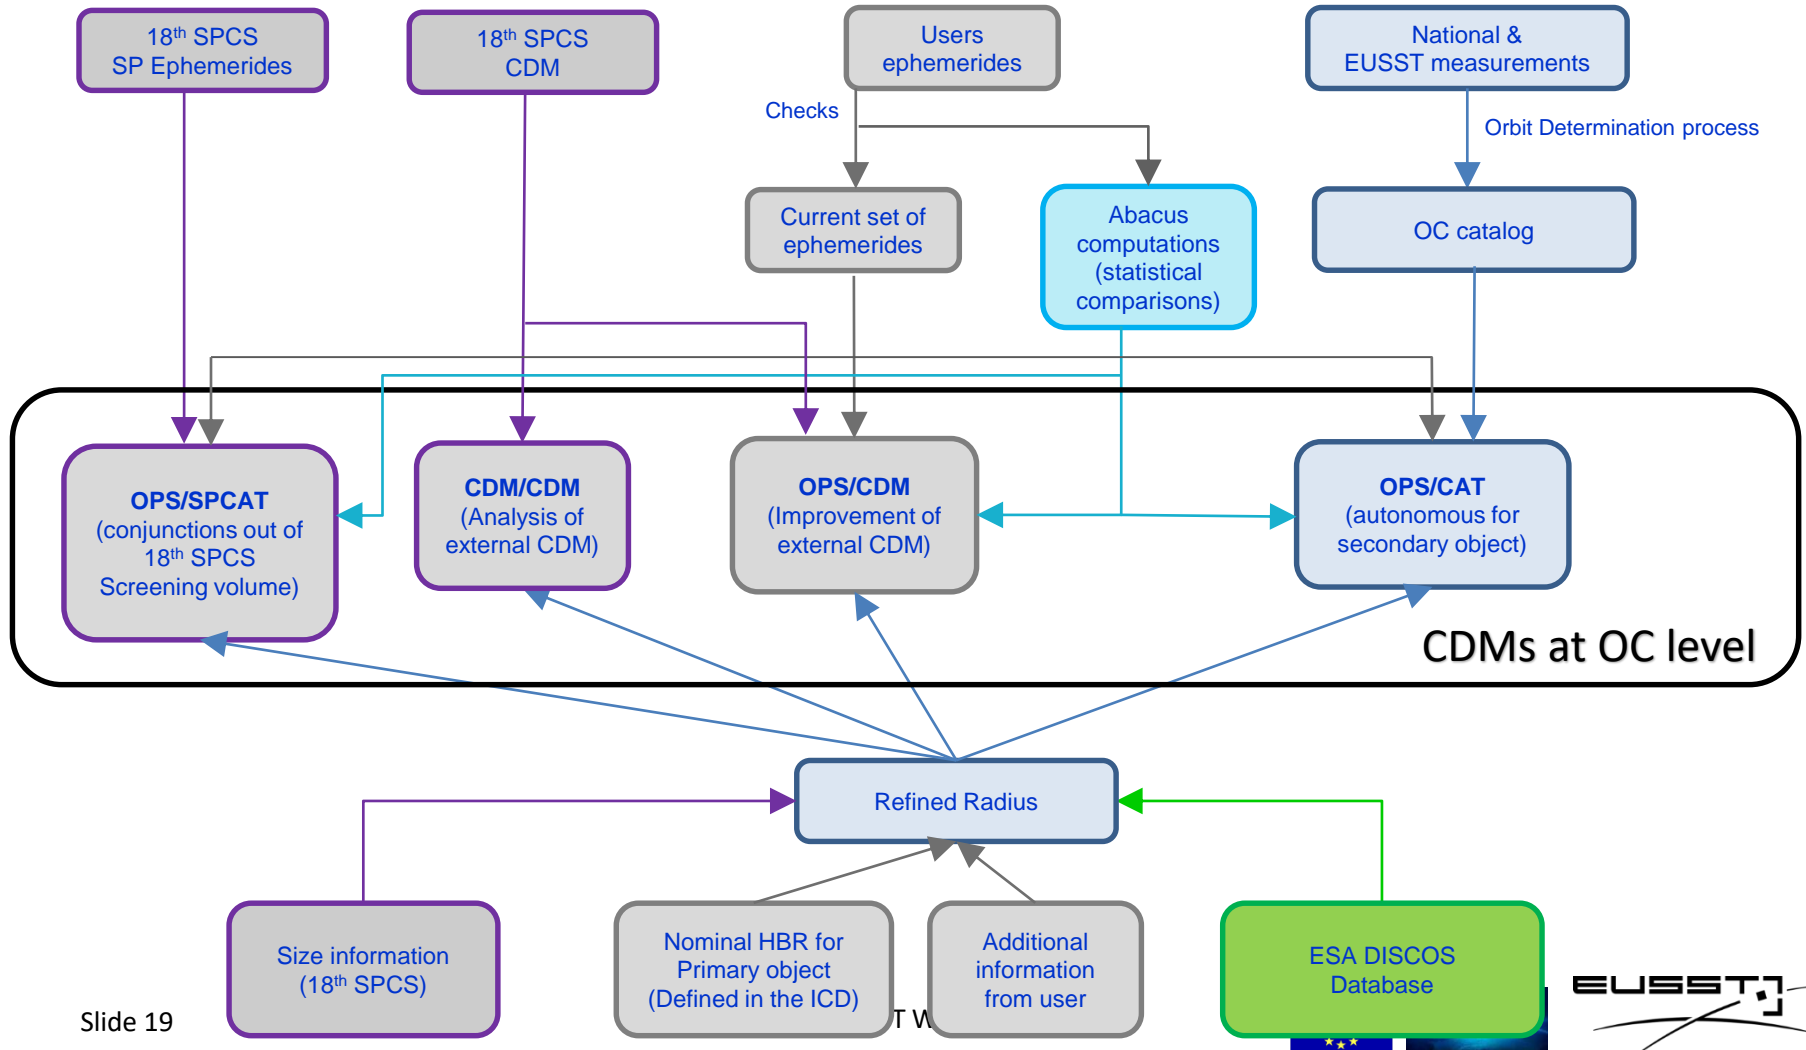

## Service provision pre-requisites

- To start the provision of CA service, the following steps are required:
  - Service Configuration Document definition and agreement (bilateral meeting between EUSST and users);
  - Ephemerides upload to EUSST Portal by users;
  - OCs access to 18<sup>th</sup> SPCS CDMs granted by users;

CONSTELLATION	MISS DISTANCE (m)		RADIAL DISTANCE (m)		Scaled POC		Time to TCA (days)	
	WARNING	ALERT	WARNING	ALERT	WARNING	ALERT	WARNING	ALERT
SAMPLESAT LEO	2000	200	200	50	1.00E-05	2.20E-05	7	5
SAMPLESAT GEO	5000	1000	1000	500	1.00E-06	-	7	7
SAMPLESAT MEO	10000	4000	-	-	1.00E-09	1.00E-08	14	14

*Example of SCD*

# Collision Avoidance Data Sources

# Collision Avoidance

## EUSST Products

- The content of the EUSST products includes:
  - Event and product identification, including severity level (e.g. ALERT)
  - Product creation date;
  - Time of Closest Approach (TCA) of the event;
  - Source of information used for the products;
  - Event characterization:
    - Miss distance;
    - Probability of Collision (PoC) including method;
    - Evolution of the conjunction geometry and of the Probability of Collision (B-plane plots and time evolution plots);
    - Probability of Collision sensitivity analysis.
  - Mitigation manoeuvres support.
- Content is provided to the users in the following formats:
  - CDM (standard to exchange CA information)
  - CA Report (associated to each CDM file).

# Collision Avoidance Covariance Abacus

- Covariance Abacus generation
  - Statistical comparison between predicted and determined (observed) orbit
  - Reference covariance for probability computation
  - Outliers detection

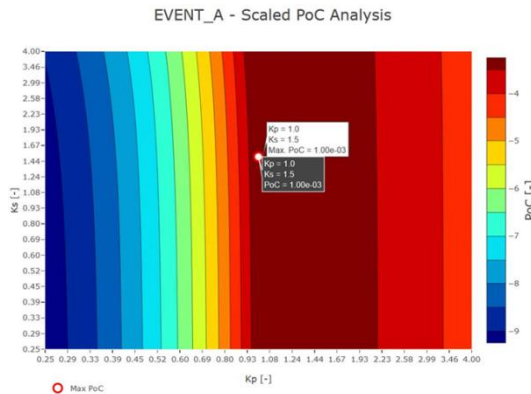

# Collision Avoidance

## PoC sensitivity analysis

Probability of Collision (PoC) sensitivity analysis:

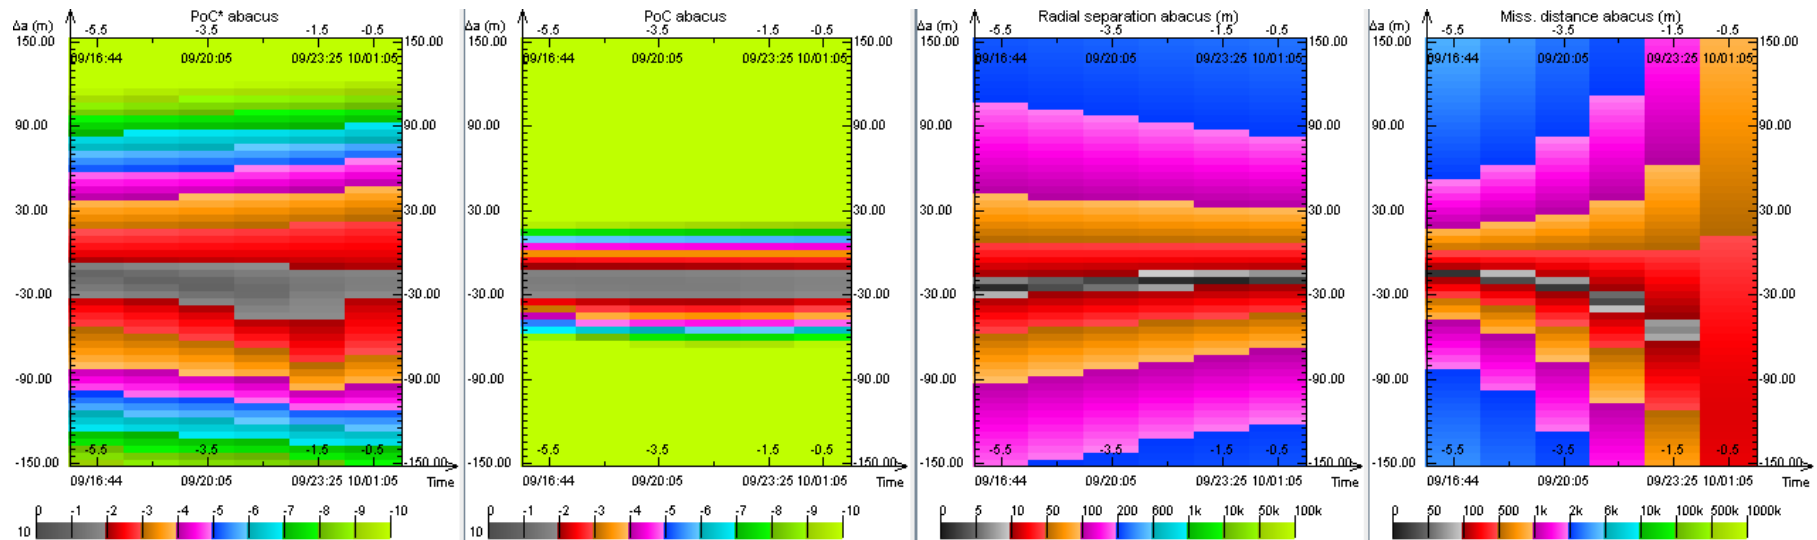

- Use of covariance abacus for PoC calculations
- Use of configurable Hard Body Radius (HBR) for PoC calculations
- PoC sensitivity analysis: Use of Scaled PoC
- Scaled PoC used as baseline PoC to trigger threshold-based alerts

# Collision Avoidance

## Mitigation recommendation and manoeuvre support

- **Mitigation recommendation and manoeuvre support**
  - Triggered by HIE detection or at O/O request

# Collision Avoidance

## HYLAS 4 (2018-033B) vs Gorizon 16 (1988-071A)

# Collision Avoidance

## HYLAS 4 (2018-033B) vs Gorizon 16 (1988-071A)

- Nominal OC worked together with the Operator to:
  - Assess a potential manoeuvre
  - Screen the new Operator's ephemeris after the potential manoeuvre
  - Finally the Operator decided to adjust the station keeping manoeuvre and @TCA minus 4 days the risk decreased to WARNING

18033B\_88071A\_1910060032\_1909251259 - CAM Miss distance Analysis

## EU SST Service Provision REST API

This document describes the EU SST Service Provision Rest API, which is meant to be used by back-end servers or trusted parties. The API provides most of the functionality available in the portal.

### Collision Avoidance Service

Show/Hide | List Operations | Expand Operations

GET	/api/ca/cdm	Retrieve the list of CDMs for the user.
GET	/api/ca/cdm/{cdmId}	Returns the Conjunction cdm for a certain id
GET	/api/ca/report	Retrieve the list of Conjunction Reports for the user.
GET	/api/ca/report/{reportId}	Returns the Conjunction report for a certain report id

### Fragmentation Analysis Service

Show/Hide | List Operations | Expand Operations

### Re-entry Analysis Service

Show/Hide | List Operations | Expand Operations

### User Data Upload Service

Show/Hide | List Operations | Expand Operations

GET	/api/file	Get all uploaded files for the user.
GET	/api/file/{dataUploadId}	Returns the file information for a certain file id
POST	/api/file/delete/{dataUploadId}	Delete a file upload.
POST	/api/file/upload	Upload a file.

Reentry Events - 10 Upcoming

No upcoming events

# Collision Avoidance Conclusions

- Provision mechanism in hot redundancy.
- Direct dialogue for HIE.
- User-oriented service (SCD).
- Autonomous products based on data provided by EUSST contributing sensors.
- Standard information (CDM) complemented by expert analysis (CA report).
- Collision Avoidance manoeuvre support.
- Service provision through User and API interfaces.

A view of Earth from space, showing the curvature of the planet and a bright blue horizon line. The background is dark, suggesting the vastness of space. The text "Re-entry Analysis Service" is overlaid in white, bold font.

# Re-entry Analysis Service

# Re-entry Analysis Service Description

## The Re-entry Analysis (RE) Service:

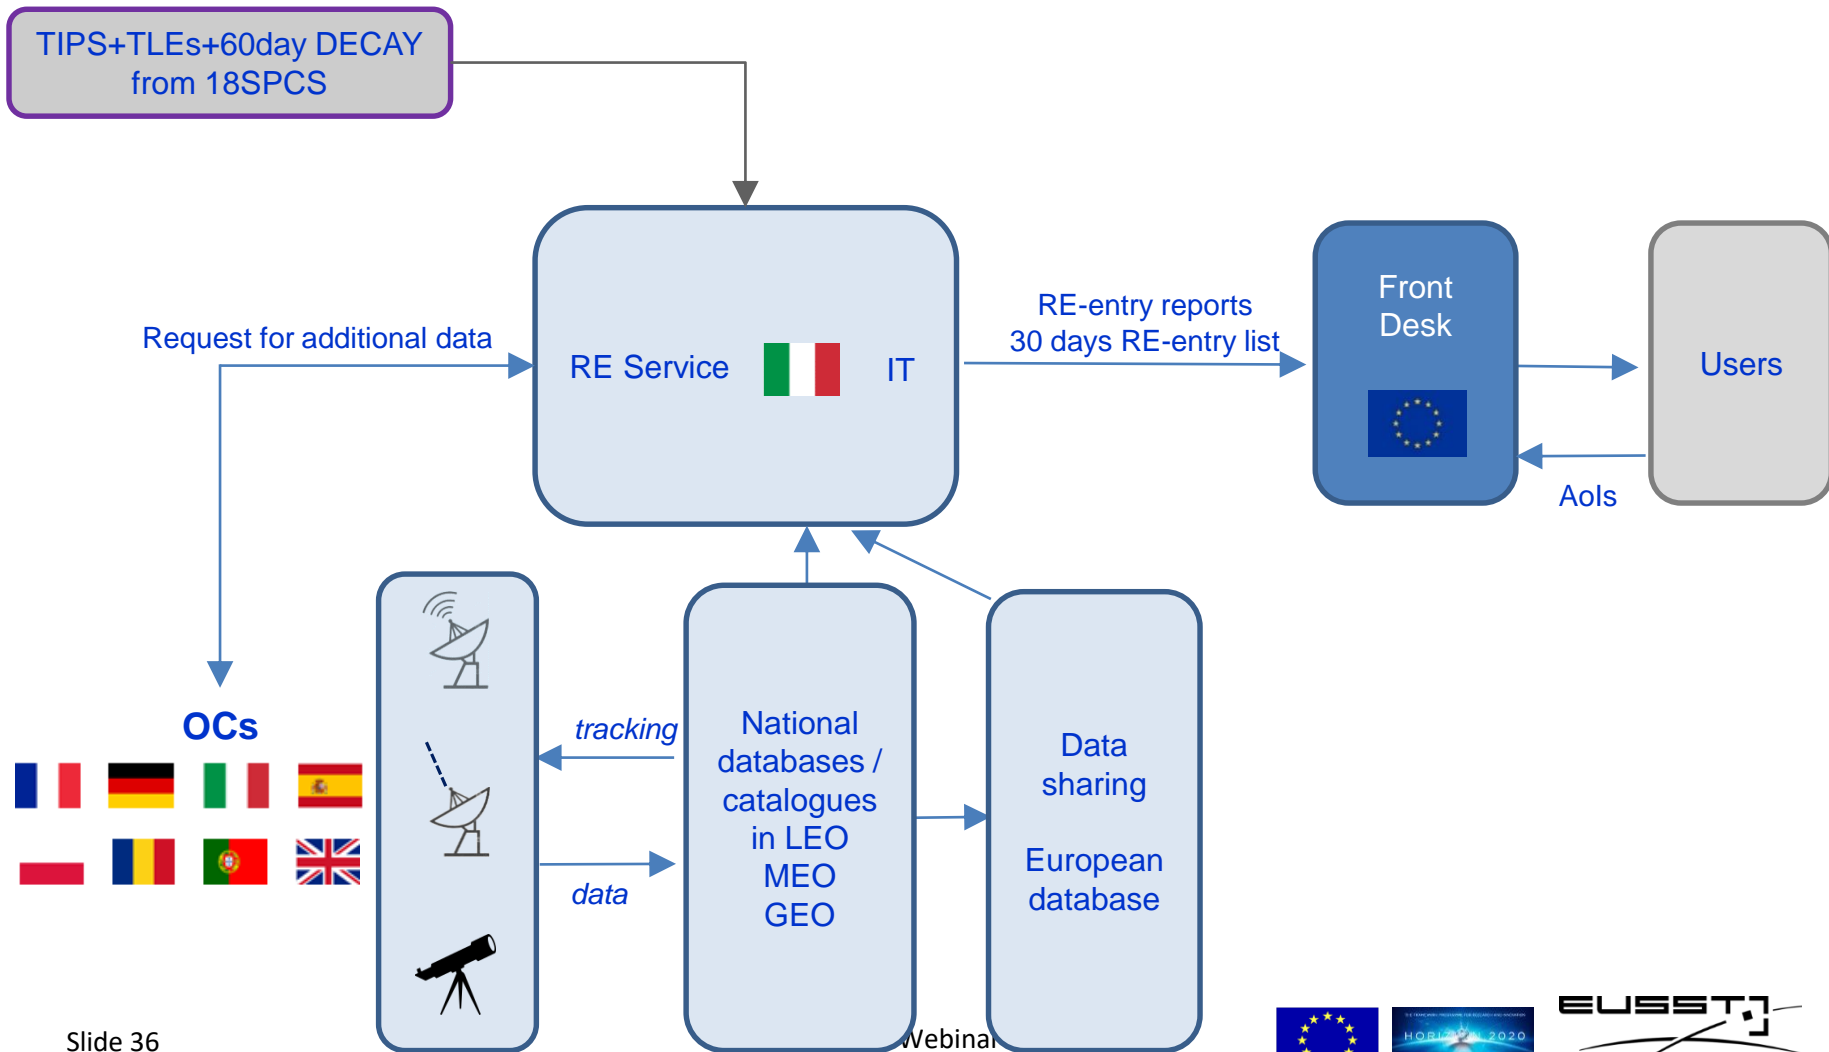

- provides the risk assessment of the uncontrolled re-entry of man-made space objects and space debris into the Earth's atmosphere and the generation of related information.
- consists on analysing all available information regarding the uncontrolled re-entries within 30 days.

# Re-entry Analysis

## Service Characteristics

- The criteria applied for the objects to be reported is:
  - Radar Cross Section (RCS) larger than  $1\text{m}^2$ ;
  - *or* mass greater than 2.000 kg;
  - *and* all rocket bodies.
- All relevant sensors operated under EUSST are contributing to the service provision;
- Re-entry information provided in accordance to users' personalised geographical Areas of Interest (Aols).

# Re-entry Analysis Provision Mechanism

# Re-entry Analysis

## EUSST Products

- The content of the EUSST products includes:
  - Object identification and characterization;
  - Object orbital information;
  - Re-entry prediction information.
- Content is provided to users as:
  - 30 Days Re-entry List;
  - Re-entry Report;

In addition, dedicated event pages are created for specific events (e.g. Tiangong-1)

EXAMPLESAT

NORAD ID: 12345

Int.Designator: 2016-099C

Creation Date (UTC): 2019-09-03T09:28:15

#### Overview

This report presents the results of the EXAMPLESAT re-entry analysis in accordance with the latest available information:

Epoch of the re-entry:	2019-08-30T04:25:03 UTC
Uncertainty of epoch:	±0h15m
Nominal re-entry point:	Lat. 48.94°N Lon. 5.3°E
Direction:	Ascending

Table 1: Re-entry information

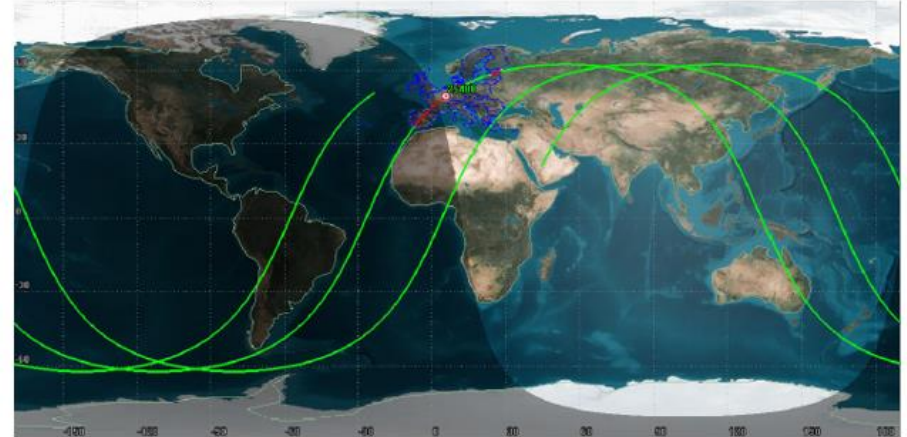

Apogee:	31989 km
Perigee:	185 km
Inclination:	62°

#### Tiangong-1

Credits: By Tiangong\_1\_drawing.png: Craigboy derivative work: 70.49.127.65 [CC BY-SA 3.0 or GFDL], via Wikimedia Commons

In early 2018 a large object of special interest will re-enter into the Earth's atmosphere: the former Chinese space station Tiangong-1 (NORAD ID: 37820 / COSPAR ID: 2011-053A). The object was launched in September 2011 by a "Long March 2" launch vehicle from Jiuquan LA-4/SLS-1 into a Low Earth Orbit (LEO) with an inclination of approximately 43°. During its operational life time the station has hosted two manned Missions with six astronauts in total. On 21.03.2016 Chinese "Manned Space Engineering Office" announced that they disabled data service to their space station. Analysis of the objects' orbit has shown that no significant manoeuvres have been made since December 2015. Since that moment in time, the height of the object has permanently dropped mainly due to the atmospherical drag. The objects' altitude decreased from its' original position of 400km to 270km by the end of January 2018. The lower the orbit the faster the decrease in altitude will be due to the increase of the atmospheres' density. Due to the mass of approximately 7600kg and its size of about 11m x 03.5m (without solar arrays) the object is of special interest.

Most recent analysis show that the object will re-enter in late March / early April plus/minus the uncertainty (typically 20% of the remaining orbital lifetime) that comes along with the re-entry prediction due to the unknown long-term behaviour of the Earth's atmosphere (influenced by the solar activity), which is mainly responsible for the decrease in orbit altitude. It can be expected that some larger pieces will survive the re-entry and reach the Earth's surface. A rough estimation is to assume the equivalent of approximately 40% of the object dry mass, which leads to a total mass of surviving fragments of approximately 3 tons. Especially massive components such as the engines, tanks or massive part of the primary structure are most likely to partially survive. In any case, these pieces will not accumulate at a certain re-entry point but instead be spread over a large area along the final trajectory, which will be approximately 1000km long and a few hundred kilometres wide. Due to the inclination of the object, the re-entry will happen between  $\pm 43^\circ$  geographical latitude. Thus all locations north and south of this latitude-band can be discarded from being affected. Consequently, mid and northern European countries such as Germany, Austria, Switzerland, Hungary or Romania, as well as most parts of France (except a small region close to the border of Spain and Corsica) are not within the re-entry region.

Within the region of  $\pm 43^\circ$  geographical latitude most part of the Earth surface is covered by ocean so the statistical probability of an impact on soil is low. However, due to the orbital mechanics, the probability of a re-entry at the northern or southern boundary ( $\pm 43^\circ$ ) of this region is a bit higher than at the equator simply because the residence time at certain latitude is lowest near the equator. Thus, European countries such as Portugal, Spain, France, Italy, Malta, Greece, Bulgaria and Rep. of Cyprus are exposed to a slightly higher risk.

Besides other organisations, this object is also being monitored by EUSST. Sensors capable of tracking the object are used to permanently collect orbit-tracking data towards the end of the orbital life time of the object. Together with data of other sources (e.g. space weather data, etc.) analysis are performed to produce the best possible estimation for the expected re-entry location and time. However, due to the large uncertainties within re-entry predictions in general (approximately  $\pm 20\%$  of the remaining lifetime) a precise estimation will be possible only a few hours before the re-entry actually occurs. Even one day in advance the uncertainty in the remaining lifetime of the object will be in the order of around 45 hours and, considering the velocity of the object, this implies a very wide portion of Earth's surface. However, based on the regions without overflights during the remaining lifetime some regions can already be excluded at an early stage.

# Re-entry analysis

## Conclusions

- Autonomous products based on data provided by EUSST contributing sensors.
- Object overflight passes provided for the re-entry predicted window.
- Users' personalised geographical areas of interest.
- Ad-hoc information for mediatic events.

# Fragmentation Analysis Service

A view of Earth from space, showing a bright blue horizon line and a dark, starry background. The Earth's surface is visible with clouds and landmasses. The text "Fragmentation Analysis Service" is overlaid in white.

# Fragmentation Analysis Service Description

## The Fragmentation Analysis (FG) Service:

- provides the detection and characterization of in-orbit fragmentations, break-ups or collisions.
- consists on analysing all available information regarding the object(s) involved in the event.

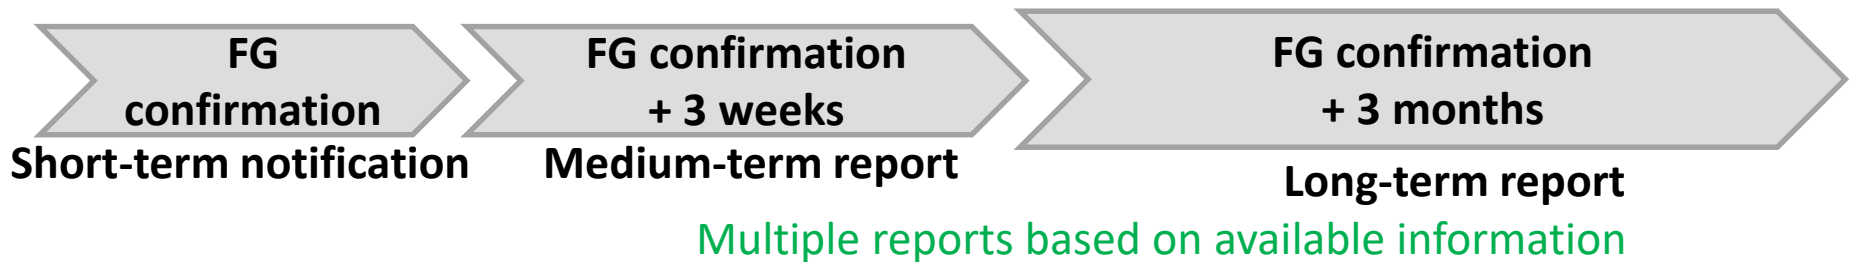

# Fragmentation Analysis

## EUSST Products

- The content of the FG Service is provided in 3 types of products:

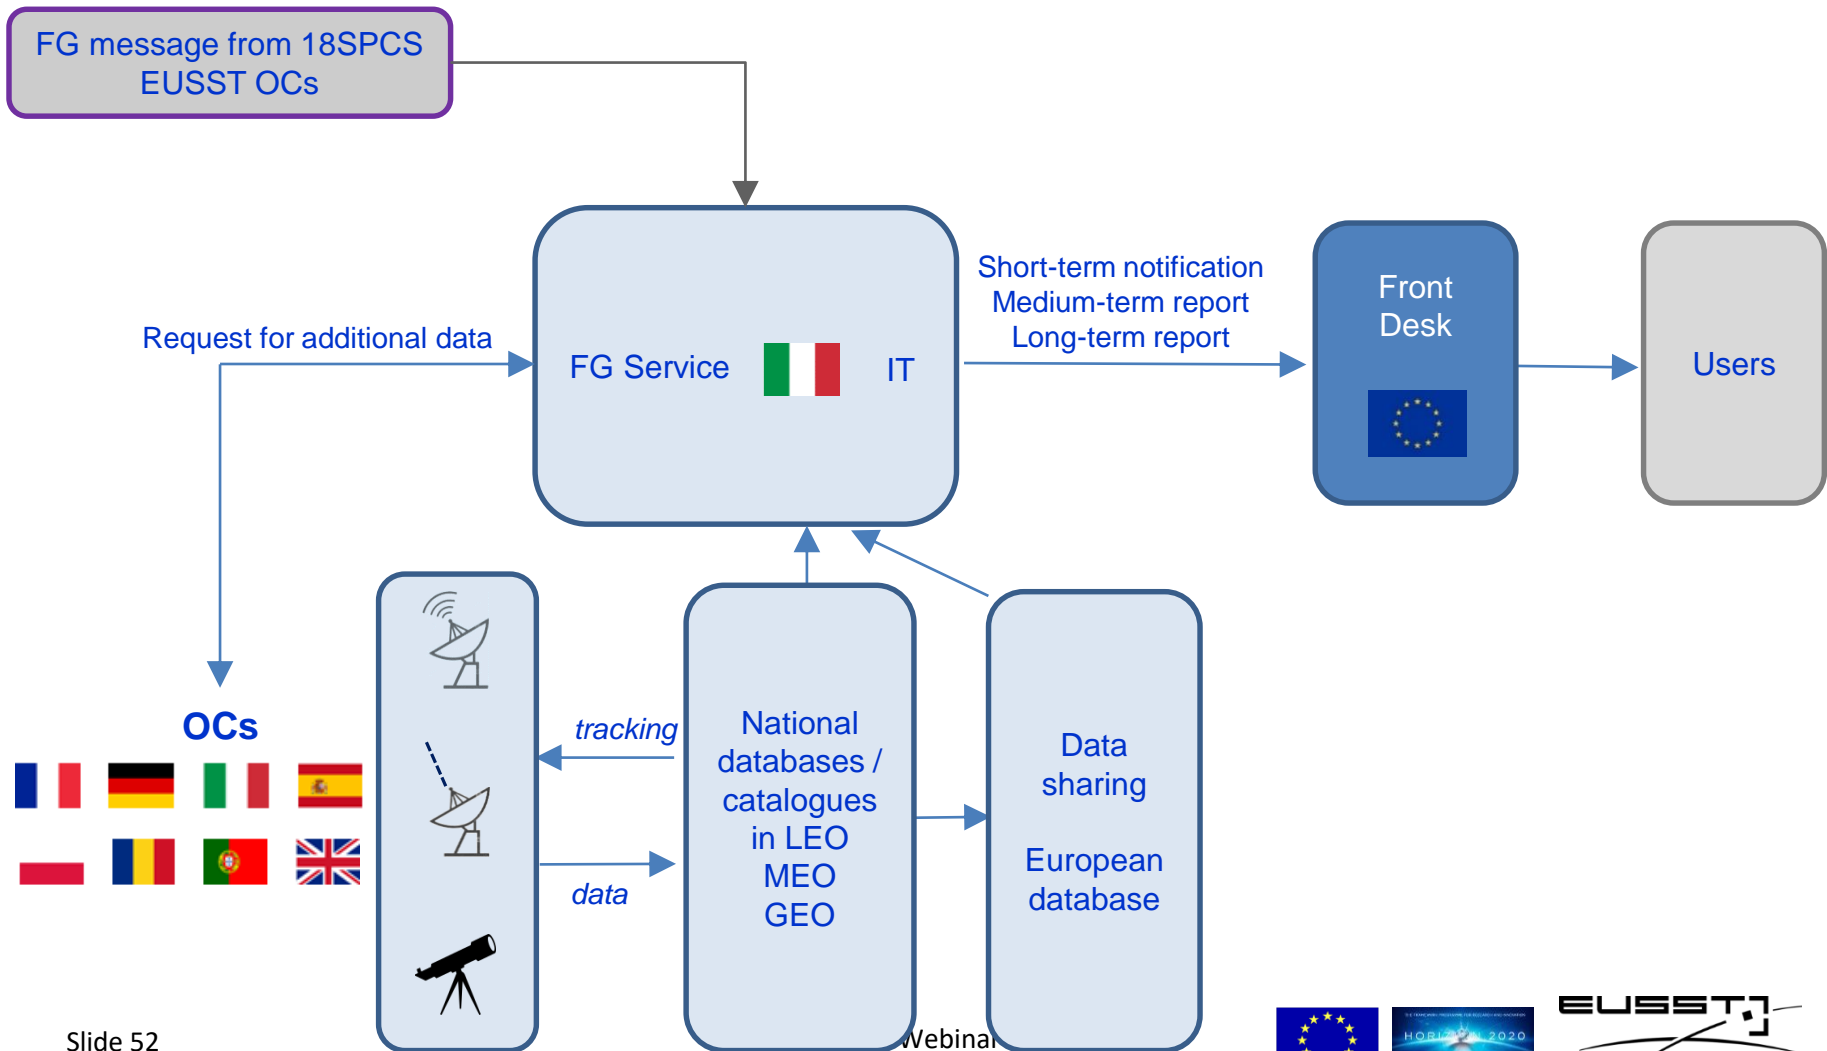

1. Short-term notification;
2. Medium-term report;
3. Long-term report.

as foreseen by the  
new Service Portfolio

- Contribution of all relevant sensors operated under EUSST is requested for all fragmentation events.
- In addition, dedicated event pages are created for mediatic events (e.g. Microsat-R)

# Fragmentation Analysis Provision Mechanism

# Fragmentation Analysis

## Short-term Notification

- The Short-term product is provided as an email containing basic information regarding the FG event. It includes:
  - **type of fragmentation** (i.e. explosion/breakup, collision, release of fragments, ASAT, other, unknown)
  - **object type** (i.e. satellite/payload, rocket body)
  - **apogee/perigee** of parent object/s with their **orbital regime** (LEO, MEO, GEO, other)
  - **number of detected fragments** if this information is available to the OC.

# Fragmentation Analysis

## Medium-term Report

- The Medium-term report provides updates of the event with the following information:
  - Fragments distribution (e.g. Gabbard diagram)
  - 3D graph of the position of the object/s
  - 3D cloud evolution of the fragments
  - Dispersion of the orbital parameters of the fragments

# Fragmentation Analysis

## Long-term Report

- Long-term report provides updates of the event with the following information:
  - Simulations of the event using an adequate breakup, collision model;
  - Area to Mass ratio distribution;
  - Delta Velocity distribution;
  - Objects' spatial density evolution;
  - Number of fragments expected greater than a given size.

Dashboard / Indian ASAT

## Indian ASAT - 27th March

On 27th March 2019, India tested its ASAT (Anti-Satellite) missile (known as Mission Shakti) destroying its own satellite MICROSAT-R (NORAD ID: 43947/COSP4R: 2019-006A), which was at an inclination of 97 degrees, apogee of 287 km and a perigee of 265 km. As a result of this ASAT test, at least 250 fragments were detected by USSTRATCOM, with a number of fragments possibly reaching altitudes up to 2200 km.

EUSST has committed to confirm, detect, track, identify, and catalogue the break-up fragments, to mitigate the risks generated by this cloud of space debris. EUSST National Operations Centres assisted their sensors, in a combined and coordinated effort aimed at collecting observations related to this break-up event. As a result, the following technical report has been prepared:

[PDF: Microsat-R\\_Technical\\_Note.pdf](#)

The video below shows the most recent orbital information, as of 9th April 2019 (combining EUSST and US Space Surveillance Network information) available for the MICROSAT-R fragments, propagated forward over an accelerated two hour period. Focusing on the altitude, the debris at perigee where the impact occurred is between 150-300 km and can be seen on the left side of the image. On the right side of the image the apogee of the debris can be seen, most of which currently orbits between 200-800 km.

Since the event detection, the available orbital information from Space-Track was used to rapidly generate the below EUSST reports (accordingly to the EUSST Service Portfolio) to quickly alert and maintain informed EUSST users.

## Fragmentation Analysis Technical Note

**Microsat-R**  
NORAD ID: 43947  
Int. Designator: 2019-006A  
Ref. Doc: EUSST\_TN\_0012

### 1. INTRODUCTION

On 27 March 2019, Prime Minister Narendra Modi announced that India had successfully conducted an anti-satellite (ASAT) test early that day.

A ballistic missile struck and destroyed an Indian Microsat-R satellite (NORAD ID: 43947; Int. Designator: 2019-006A) at approximately 05:40 UTC on 27 March 2019. Due to the significance of this event, the SST Cooperation worked on the following technical note, which complements the EUSST Fragmentation service as described in the "Service Portfolio" document, in order to provide users with comprehensive information, including a detailed post-analysis of all the data gathered on this High-Interest Event (HIE). In the next sections the information available to date and the conclusions based on early observations, post-processing and simulations are summarised.

### 2. EARLY REPORTING AND OBSERVATIONS OF THE EVENT

On the same day of the event, the EUSST Cooperation published its first report based on Space-Track.org information, which was the most complete openly available at that moment. All National OCs were immediately requested by the lead OC to provide available information and observations of the event. The following national sensors contributing to EUSST were able to provide observations:

# Fragmentation analysis

## Conclusions

- Autonomous products based on data provided by EUSST contributing sensors.
- Advanced analysis performed within 3 months after the confirmation of the FG event.
- Ad-hoc information for mediatic events.

# Questions and Answers

A photograph of Earth from space, showing the horizon and a thin blue atmosphere. The title 'Questions and Answers' is overlaid in white text.

# Conclusions

The image is a composite background. The lower half shows a view of Earth from space, with a curved horizon line. The sky above the horizon is a deep blue, transitioning to a lighter blue near the surface. Below the horizon, the Earth's surface is visible, showing clouds and landmasses in shades of blue and brown. The upper half of the image is a solid black space, with a faint, colorful comet or meteor streak visible in the top right corner. The word "Conclusions" is centered in the middle of the image, written in a bold, white, sans-serif font.

# Conclusions

- The EU SST Support Framework was established in 2014 to ensure the long-term availability of European and national space infrastructure, facilities and services, which are essential for the economies, societies and citizens in Europe.
- Currently, 8 EU MS and the EU SatCen are cooperating in the provision of the SST services: Collision Avoidance, Re-entry analysis and Fragmentation Analysis.
- The EUSST Front Desk is the main interface towards the users for the provision of services and user support.
- This webinar is the first of a series of webinars planned under the EU SST Support Framework activities.
- Access to the SST services can be requested through the EUSST Portal at [sst.satcen.europa.eu](http://sst.satcen.europa.eu)

The background of the slide is a photograph of Earth from space, showing the curvature of the planet and a thin blue atmosphere. A bright, multi-colored streak, likely a satellite launch trail, is visible in the upper right corner.
